

Astrolabe Inspiration

This was a lesson worth learning. Pan's ire lies in the darkness, as it ever has. Thankfully I cloaked my origin with illusion and managed to deflect its grasp upon my escape. I can't expect to be so lucky a second time. I do understand why the Conservatory's simpleminded solution was always prohibition, shutter the observatories, ban deeper mappings, punish those who sought to look too far. Typical. They say they reward curiosity but everyone knows they only reward conformity. Any elf can be a mage, bleh, I digress. If I'm not strong enough to stare between the stars now then I certainly won't be in a year, a decade, or maybe ever. No, I don't think protective strength is the answer here.

This afternoon, while reviewing past alignments (Chauncy was able to procure an astronomical log from a funerary auction), I noticed a peculiar relationship between the paths of the four wanderers and their patterns of brightness. Tracking their apexes and low-points I couldn't help but see shapes, cyclical and geometric, writ across the stars. We sit at a vertex of a celestial pentagram washed in starlight and we never even knew it! I can't be the first to see this, maybe it's why my ancestors chose this place. Pan, for all its malice, does not seem to see through celestial bodies themselves, only the void between them. What if I could use those five lights as glyph scaffolding? Controlling these stars is madness (though madness seems better and better the longer I'm away from the city) I should start smaller. If I use the five points to outline a lens... Yes! I can scatter my thought through an evanescent wave and emerge elsewhere in the cosmos without ever exposing my person to the stormy void. I feel... electric. This may finally be an idea worth the trouble of exile.
